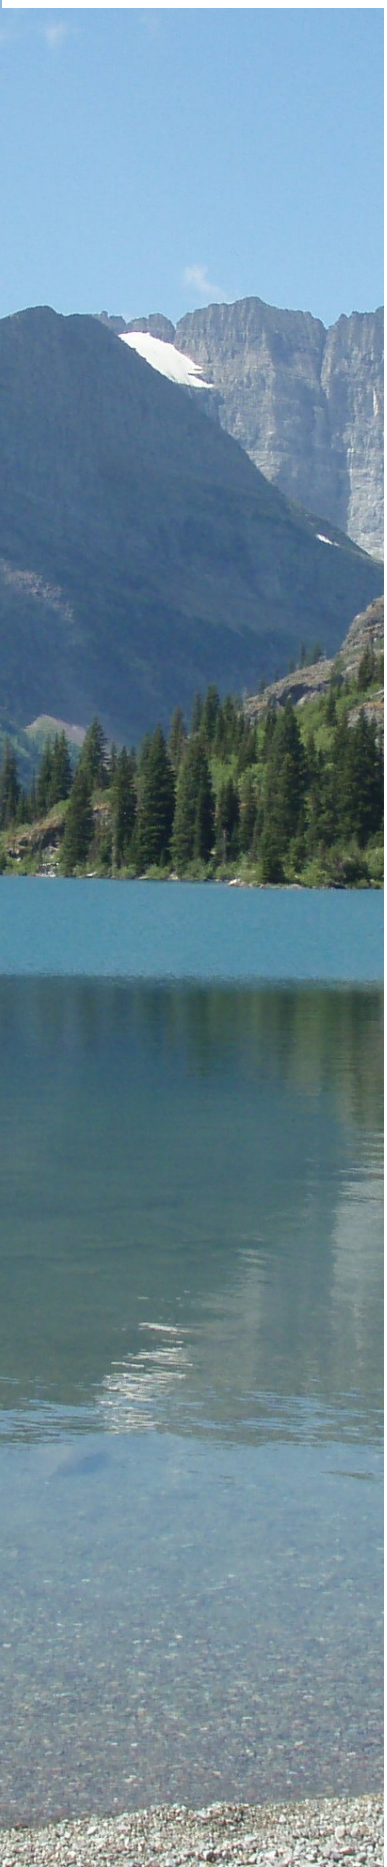
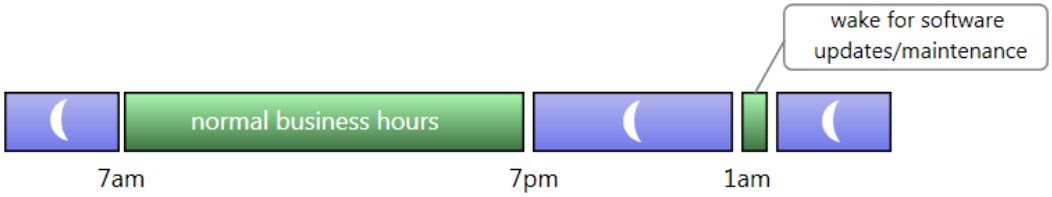
SetPower
enterprise edition



SetPower allows an enterprise precise control of its computers' power states so that the company may enact power-saving policies and green initiatives. This can result in significant cost reduction, without impacting employee productivity or workstation manageability.

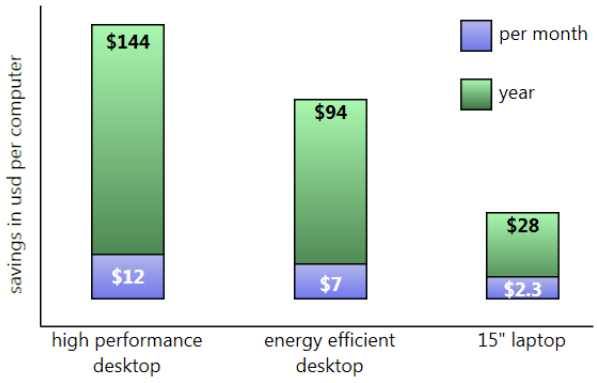
By allowing computers to go into a low power state (sleep mode) only during the parts of the day that the computers are unlikely to be used, SetPower can easily cut power costs in half. SetPower's management tools allow you to layout a schedule that can be customized for different types of employees and computers.



SetPower will wake up computers just prior to working hours, allowing employees to start working right away without waiting through a lengthy boot process. In addition, SetPower can configure settings such as the idle time before turning off the display. To allow for centrally administered maintenance, such as automated software installation or nightly virus lists, SetPower can be configured to wake machines at a predetermined time. SetPower will not interfere with normally scheduled wake events like defragmentation or automated backups.

ROI

SetPower's low client access license cost of $5 per computer allows for an extremely fast return on investment. In addition, because the cost savings are easy to monitor and measure, it is easy to prove why a small investment in SetPower is a smart business decision.



In an organization with 100 desktops you could save over **$14,000.00** per year.

Setpower consumes zero resources on the client system for 99.9% of the day, keeping workstations running at their peak performance. SetPower can be installed in a matter of hours and starts providing savings right away.

SetPower—save some green.
